metering pump technology!**

**The Heart of Industry**

# A new generation of advanced metering pump technology!

## *Hi-Techno Pump*

**IX**

Highly precise control offers a solution for every chemical dosing application.

Iwaki's IX Series are digitally controlled direct-drive diaphragm pumps. Years of experience in high-end motor technology result in extremely accurate and energy efficient metering pumps with high resolution. The IX Series meet today's demand for automated chemical delivery in industries from water treatment to chemical process.

High turn down ratio

Viscous liquid transfer

Cavitation prevention

Automatic control

Energy savings  
and Eco-friendly

Constant injection  
with low impact

Degassing

Safety design

Precise chemical  
dosing operation

IP65

Calibration

User friendly design

Efficient pump head design  
is incorporated  
with high compression

Compliant to  
world standards

Operation history

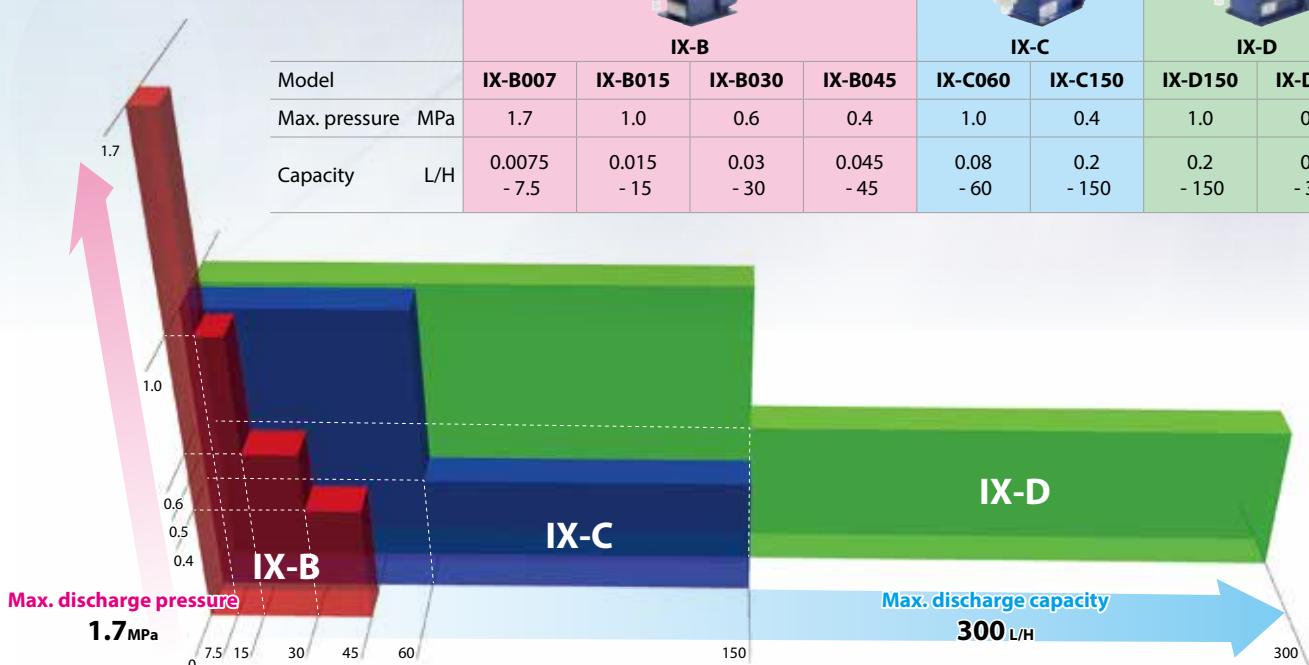

Flexible Installation

## High turn down ratio

Max. capacity range : 0.0075 - 300L/H, Max. pressure : 1.7MPa covers wide flow range.

Model	IX-B				IX-C		IX-D	
	IX-B007	IX-B015	IX-B030	IX-B045	IX-C060	IX-C150	IX-D150	IX-D300
Max. pressure MPa	1.7	1.0	0.6	0.4	1.0	0.4	1.0	0.5
Capacity L/H	0.0075 - 7.5	0.015 - 15	0.03 - 30	0.045 - 45	0.08 - 60	0.2 - 150	0.2 - 150	0.4 - 300

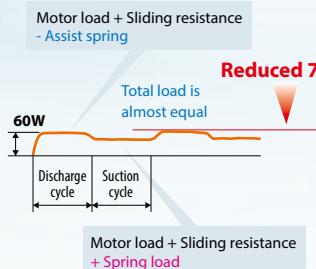

## Energy savings and Eco-friendly

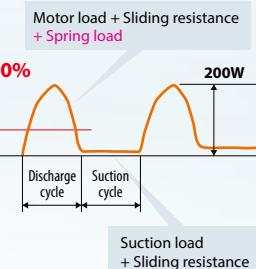

With the use of helical gears and spring assistance, power consumption is reduced by 70% compared to the standard spring back design.

\*For IX-C type

### Assist spring design

### Spring back design

## Precise chemical dosing operation

The valve design maintains precise dosing at any flow rate whilst the motor regulates discharge and suction speeds to achieve high accuracy (+/-1%) all with a cost effective design from a mechanically driven diaphragm pump.

\*Some low flow rate areas are excluded.

## Efficient pump head design is incorporated with high compression

Fast priming without air locks is achieved with a high compression ratio due to a fixed (maximum) stroke length.

### Maximum suction lift:

**2m** With an open discharge line and dry valve condition.

### Degassing ability :

IX-B007 : 1.0MPa	IX-B015 : 1.0MPa
IX-B030 : 0.6MPa	IX-B045 : 0.4MPa
IX-C060 : 1.0MPa	IX-C150 : 0.4MPa
IX-D150 : 1.0MPa	IX-D300 : 0.5MPa

With a standard tubing layout.

## Viscous liquid transfer

Standard IX series is capable of pumping liquid viscosities of up to IX-B: 500mPa·s (IX-B045), IX-C: 1000mPa·s, IX-D: 300mPa·s. Contact us for higher viscosity applications.

\*When transferring viscous liquid, the discharge rate may decrease. Custom orders are also available for viscosities of 1000 mPa · s and above. Please contact us for details.

## IP65

Drive and control units are sealed separately to an IP65 enclosure.

## Compliant to world standards

One of the IX features is multi-voltage operation (100-240VAC) compatible worldwide. Compliant to UL, CE standards.

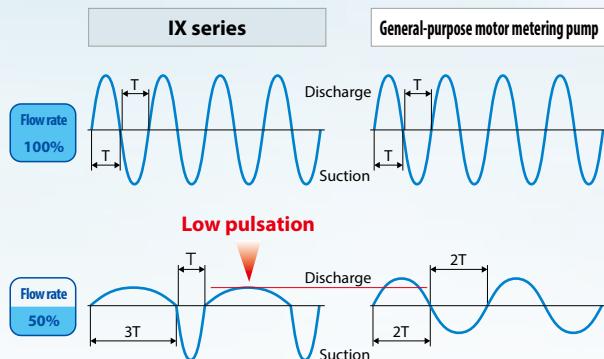

## Constant injection with low impact

Flow control via discharge speed adjustment (with a fixed suction speed) assures constant injection at any flow rate. This system also reduces impact (inertia force) and load to the discharge line.

## Cavitation prevention

When pumping viscous liquids, suction stroke speed can be varied to avoid developing cavitation.

(Programmable suction speed: 75%, 50% or 25% of the normal speed)

## Degassing

Keypad operation or the contact signal (AUX) runs the pump at maximum spm in any mode for degassing.

## Calibration

The pump is calibrated prior to shipment, however we recommend re-calibration when installed in your system due to pipe layout and liquid properties.

## Operation history

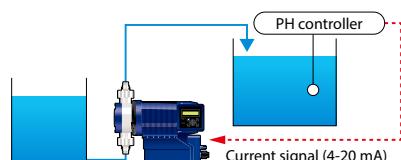

Controller memory logs the total power connection time, operating time, number of strokes and number of power-up events.

## Automatic control

The IX can run in analogue, pulse, batch or interval batch modes.

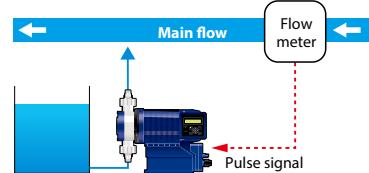

### Analogue operation

The pump operates in response to an input, (4-20mA) from a controller.

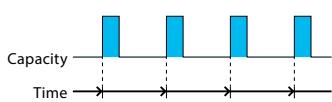

### Pulse operation

When combined with a flow meter or contact head water meter, the IX pump gives a paced dose rate in proportion to the main flow rate.

### Interval batch operation

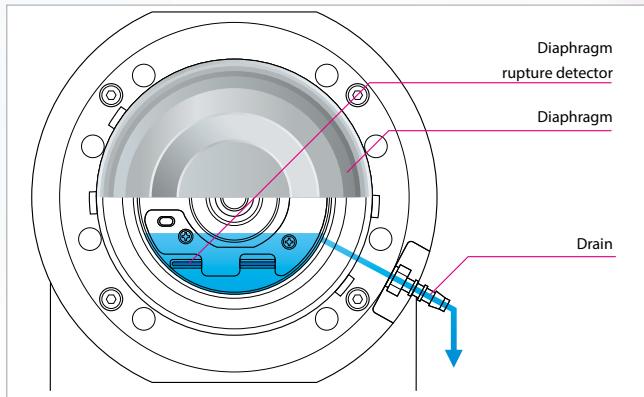

Timed operation is possible with simple pump programming via the keypad and is initiated with a pulse signal.

## Safety design

Standard to all models is a diaphragm rupture detector, protecting users and the environment. Also, a detector for abnormal operation protects the pipework in case of an accidental high discharge pressure caused by clogging or improper operation. A drain hole also ensures safe operation even when the diaphragm is damaged.

\*In some cases it may not be able to detect sudden rises in pressure occurring in shutoff operation. If the piping or machinery in use has low pressure resistance, install a separate safety valve.

## IX-B with excellent utility

### Excellent corrosion resistance

PVDF with excellent corrosion resistance is used as standard for the wet end materials. The 100% fluororesin diaphragm also supports liquid transfer, which is easily permeable to gas.

### LED Status Bar

A large LED status bar provides simple visual indication of operating conditions at a glance. It is easily visible to see the pump status at a distance or in dark locations.

### Flexible Connections

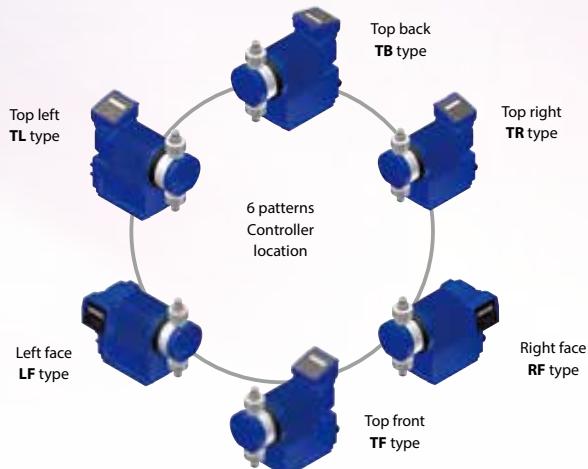

Tubing, Threaded, Flanged or Union (Made by George Fisher) connections are available as standard options providing easy installation for any application.

## User friendly design

### Operator mind design (IX-C/D)

The controller position can be selected from 6 mounting positions for operator convenience. Also, a character LCD with LED backlight and optimized keypad positions assist easy operation.

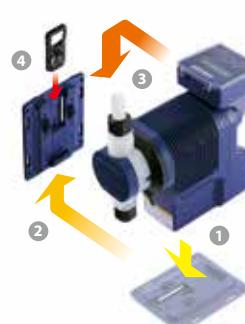

### Flexible Installation Patent

(Patented country : Japan, USA, Germany, France, Denmark, China)

The IX-B Pumps have been designed to be installed into various locations. The control unit can easily be repositioned by customers on-site. The pump can also be relocated from base mounted to wall mounted without any extra parts required.

\*IX-B-S6 cannot be wall-mounted.

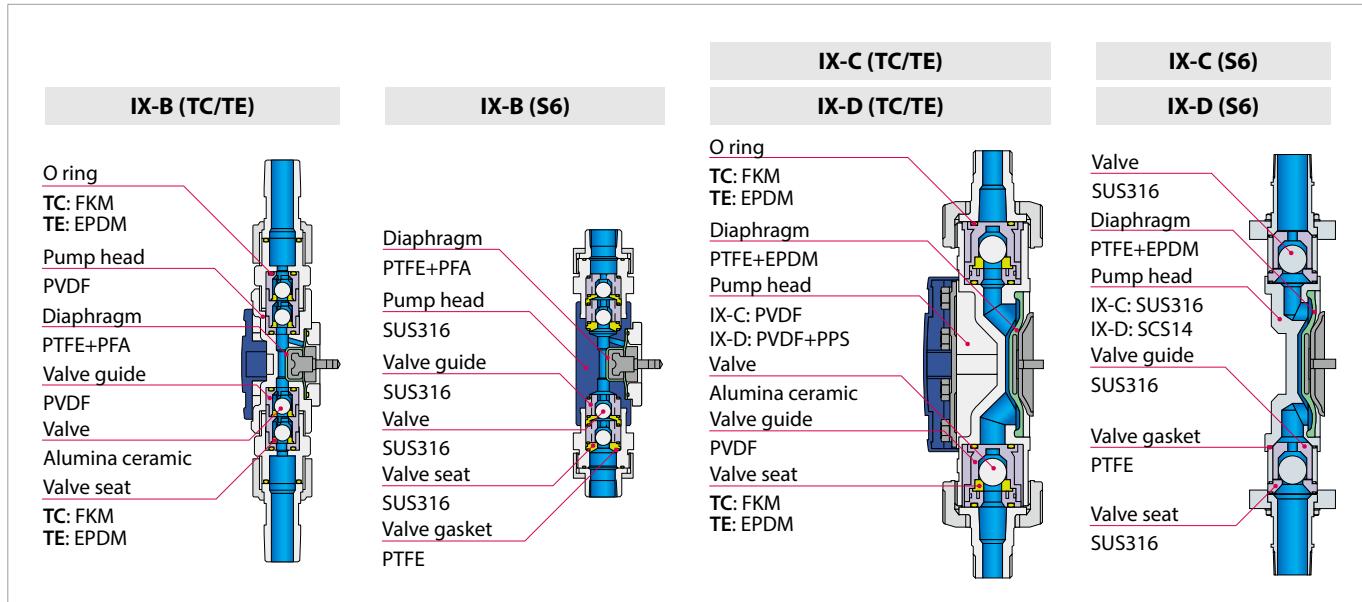

- ① Remove the pump base.
- ② Fix the pump base.
- ③ Hook the pump body.
- ④ Fix it with an adapter.

Installation example  
(with wall)

# Construction and materials

Note : PPS of the pump head and PFA/EPDM of the diaphragm is not wet end materials.

## Optional accessories / example of piping

### Check valve

Attached to the hose on the discharge side. It prevents overfeeding and backflow of the chemical solution and also prevents siphon.

Model	Body	Material Spring	O-ring	Set pressure		Connection		Applicable pump
				MPa		IN	OUT	
CAN-1VC-M	PVC	Hastelloy C276	FKM	0.17	$\pm 0.04$	Hose connection $\varnothing 4 \times \varnothing 9^{Note1}$ , $\varnothing 4 \times \varnothing 6$	Thread connection R3/8, R1/2	IX-B007/015
CAN-1VE-M			EPDM			Hose connection $\varnothing 8 \times \varnothing 13^{Note1}$ , $\varnothing 9 \times \varnothing 12$	Thread connection R3/8, R1/2	
CAN-2VC-M			FKM	0.2	$\pm 0.04$	Thread connection Rc1/4	Thread connection Rc1/4	
CAN-2VE-M			EPDM			$\pm 0.03$	Thread connection Rc3/8	
CS-1S	SUS316	PTFE <sup>Note2</sup>		0.2	$\pm 0.04$	Thread connection Rc1/4	Thread connection Rc1/4	IX-B007/015
CS-2S						$\pm 0.03$	Thread connection Rc3/8	IX-B030/045

Note1 : Applicable hose diameter can be changed. Refer to "Connection Diameter of the Multi-connection" on page 12 for details.

Note2 : The sealing of CS type is a gasket.

### Relief valve Model RV

Positive displacement pumps keep operating even in a closed-discharge condition, resulting in piping breakage or pump failure from overpressurization without a relief valve. Always install a relief valve to prevent overpressure in the discharge line.

Model	Body	Material Diaphragm	O-ring	Max. capacity L/min (L/H)	Set pressure MPa	Connection JIS10K Flange	Applicable pump	Mass kg	
RV-3T □-15	PVDF	PTFE	FKM EPDM	3.0 (180)	0.3 - 1.0	15A DIN PN10 DN15 ANSI 150LB 1/2 <sup>Note2</sup>	IX-B, C060	0.7

RV-756B-25					0.8 - 1.5				

Note1 : When connecting a hose, use it at a hose normal pressure or less. When used with the IX-B007 (C/E) type pump, it can be installed in a pressure range of 0.3 to 1.7 MPa. However, the maximum flow rate is 0.125L/min (7.52L/H).

Note2 : The flange is a shared product that complies with the standards listed in the table.

# Optional accessories

## Back pressure valve

### Model BV

Install a back pressure valve when discharge-line pressure is less than 0.03 MPa or less than suction-line pressure. Pump check valves may otherwise not operate correctly and overfeeding may result. Differential pressure between discharge and suction lines must be 0.03 MPa or more and also greater than the inertia resistance (Pid or Pis, whichever greater). Differential pressure (0.03 MPa or more) > Inertia resistance (Pid or Pis, whichever is greater)

PVDF type

2

PVC type

## Air chamber Model A

The air chamber reduces flow pulsation to prevent piping vibration and overfeeding. An air chamber designed for slurry transfer is also available.

Contact us for detail.

Note1 : Use below the maximum allowable pressure of a connected tube. Note3 : A dedicated valve is required when using with high-viscosity liquid.

Note2 : When transferring viscous liquid, the discharge rate may decrease. When selecting a pump, allow a margin for the discharge amount.

Note4 : For the IX-B, accuracy is not guaranteed at flows below 30 mL/h. For the IX-C060, accuracy is not guaranteed at flows below 0.4 L/h. For the IX-C150, accuracy is not guaranteed at flows below 1.0 L/h.

For the IX-D150, accuracy is not guaranteed at flows below 1.5 L/h. For the IX-D300, accuracy is not guaranteed at flows below 3.0 L/h.

Note5 : Flanges will be shared with the standards listed in the table.

• The above is the value at rated voltage, ambient temperature and clear water. • The pressure at which the abnormal pressure detection function operates is 1.3 to 2 times the maximum discharge pressure.

• No viscosity change, Non freezing, No slurry. • The max. discharge capacity is obtained in operation with clear water at ambient temperature and the max. discharge pressure. It gets higher as the pressure gets lower.

• Operating humidity range: 30~90%RH (Non condensing in the controller) • Operating temperature range: 0~50 °C (Indoor use only) • Contact us for other plumbing connections.

## Controllers

		MAN (Manual)		Use the UP and DOWN keys to set a flow rate.		
		Analog fixed operation		4~20, 0~20, 20~4, 20~0 mA (Proportional to the discharge rate)		
		Analog variable operation		Programmable 2-point setting (Input signal DC 0~20 mA, proportional to the discharge rate)

	Pulse	Non-voltage contact or open collector Max pulse frequency is 100Hz. (Pulse ON: 5 msec or more)				
Output	Alarm1 (OUT1)	Non-voltage contact (mechanical relay): AC 250 V, 3 A (resistive load) Each output item is selected by Enable/Disable. Batch complete <sup>Note4</sup> /STOP/Pre-Stop/Interlock/Leak Detection/Motor Overload/Drive Error				
	Alarm2 (OUT2)	Non-voltage contact (photo relay): AC/DC 24 V, 0.1 A (resistive load) Each output item is selected by Enable/Disable. Volume Prop. PLS <sup>Note6</sup> /Batch complete <sup>Note5</sup> /STOP/Pre-Stop/Interlock/Leak Detection/Motor Overload/Drive Error				
	External power supply	DC 12 V, 30 mA or less				
	Current	DC 0~20 mA, Two-point setting (allowable load resistance: 300 Ω)				
Power voltage <sup>Note7</sup>		100~240VAC 50/60Hz				

Note1 : The minimum settings for pulse operation, batch operation, and interval batch operation are the flow rates per stroke corrected by calibration.

Also, the change rate of the setting value per pulse is the flow rates per stroke corrected by calibration.

Note2 : A separate Profibus conversion BOX (option) is required to operate Profibus on IX.

Note3 : Switches to pump operation with input contact if default state is changed in the controller settings.

Note4 : The maximum voltage and current applied to the contact are 12 V and 5 mA. If you use a contact such as a relay, the minimum applicable load must be 5 mA or less.

Note5 : When Batch Complete (batch operation complete output) is set to Enable, the other functions will be set to Disable.

Note6 : When Volume Prop. PLS output is set to Enable, the other functions will be set to Disable.

Note7 : Do not apply voltage out of the specified range. Doing so may cause malfunction or failure. The allowable voltage supply range is 90~264VAC only.

# Performance

•  $P_i$  : Inertia resistance per meter (based on clean water, suction line I.D. should be equal to the pump suction connection as a minimum.)

Calculate inertia resistance per meter using the following formula.

$$P_i = P_{id} \times \text{Specific gravity} \times \text{Pipe length (m)} \times (\text{Pump I.D.} \div \text{Pipe I.D.})^2 (\text{MPa})$$

• Suction speed is set to 100% as the default setting. Reduce speed when handling viscous or gaseous liquids to prevent the possibility of cavitation.

Note the suction speed is used to control maximum discharge capacity.

e.g.) If suction speed is set to 75%, maximum discharge capacity is correspondingly reduced to 75% (45L/h for IX-C060, 113 L/h for IX-C150).

• Discharge capacity may be reduced from rated performance when pumping highly viscous liquids. Select a suitable pump size according to liquid viscosity.

Contact us if handling liquid viscosities of over 1000 mPa·s.(IX-C) Contact us if handling liquid viscosities of over 300 mPa·s.(IX-D)

• Applicable chamber: Capacities are based on Ivaki standard chamber sizes. Contact us for chamber materials.

• High accuracy: ±1% (This accuracy may not be met at flows below 1.0 L/h for the IX-C150S6. For model IX-C060S6, accuracy may not be met at flows below 0.4 L/h)

• Liquid temperature range: 0-50 °C(TC/TE type), 0-80 °C(S6 type) No viscosity change, Non freezing, No slurry

Accurate calibration may not be possible with liquid temperatures over 60°C and discharge pressures over 0.8MPa. For optimum accuracy, calibration must be performed below these parameters.

# Points to be observed in pump installation and piping

IX Series Hi-Techno pumps are positive-displacement, reciprocating pumps. Reciprocating pumps generate pulsation in the suction and discharge piping. Special consideration, (different from the ordinary centrifugal pumps), should be given to this point when planning the pump installation and piping.

## • Prevention of pipe vibration

**Discharge side inertial resistance  $P_{id} < 0.1 \text{ MPa}$**   
 •  $P_{id}$  : Inertial resistance on discharge side

Inertial resistance means the pulsated impact force generated by the flow just upon entering discharge stroke. It is a phenomenon particular to a reciprocating pump which is generated as a result of the sudden application of acceleration to the liquid in the discharge piping. The condition " $P_{id} < 0.1 \text{ MPa}$ " is given above as an approximate standard. If  $P_{id}$  becomes  $0.1 \text{ MPa}$  or higher, vibration on the pipe is generated. So measures should be taken to cope with the influence of vibration on the pump, too.

### Measures

1. Install pulsation prevention device (air chamber).
2. Enlarge the diameter and shorten the length of the discharge piping.

## • Prevention of overfeeding

**Pump differential pressure > Inertial resistance  $P_i$**   
 • The larger one of the suction side or the discharge side

Overfeeding means excessive flow of the liquid due to abnormal functioning of the check valve caused by pulsation of the liquid in the piping. Check carefully in case the differential pressure is low and in case the piping is too long even with the differential pressure value at  $0.03 \text{ MPa}$ .

### Measures

1. Install air chamber.
2. Install back pressure valve

## • Prevention of suction failure

**$NPSHa > NPSHr$**   

$$NPSHa = P_a - P_v \pm P_{hs} - P_{is} * \text{MPa}$$
  
 \*Or  $P_{fs}$  whichever is the larger. ( $NPSH$  : Net positive suction head)

If  $NPSHa$  is not sufficient, the pump may be damaged by the flow-break or cavitation generated under such conditions.

- $NPSHa$ : Absolute NPSH (MPa)
- $NPSHr$ : Required NPSH (value particular to the pump) (MPa)
- $P_a$ : Absolute pressure onto the tank liquid surface (MPa)
- $P_v$ : Liquid vapour pressure (MPa)
- $P_{hs}$ : Pressure caused by the height of the suction side (MPa)  
(Flooded suction : +, Negative suction : -)
- $P_{is}$ : Inertial resistance on the suction side (MPa)
- $P_{fs}$ : Piping resistance on the suction side (MPa)

See the table below for  $NPSHr$ , inertia resistance( $P_i$ ) and applicable chambers.

 Compressed air dissolves in solutions in a chamber. Supply air into the chamber periodically, or its performance may reduce.  
It takes longer time for air to be compressed enough to deliver liquid as a flow rate gets lower.

## • Pump/Piping protection

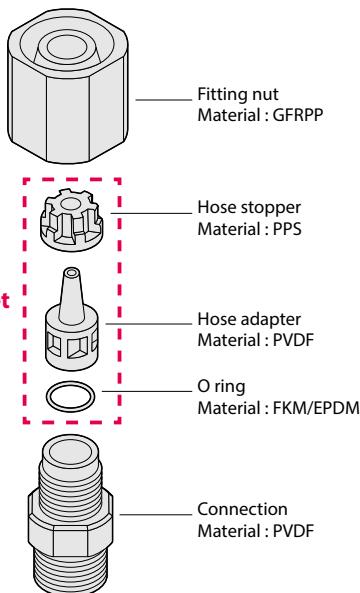

Install a relief valve to protect the pump and piping from overpressure.

# Connection diameter of multi-joint

The applicable hose diameter can be switched by removing the fitting nut and recombining the hose stopper and hose adapter.

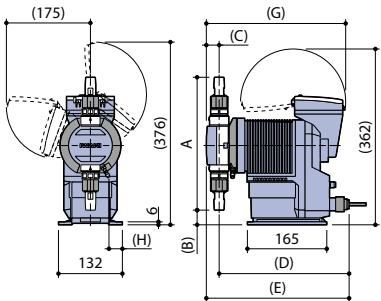

In addition, a hose stopper, hose adapter, and O-ring are available as a connection set. Please see the chart on the right for details.
